## About this review

For 64 years, the *BP Statistical Review of World Energy* has provided high-quality objective and globally consistent data on world energy markets. The review is one of the most widely respected and authoritative publications in the field of energy economics, used for reference by the media, academia, world governments and energy companies. A new edition is published every June.

## Find more online

### Key information

The website contains all the tables and charts found in the latest printed edition, plus a number of extras, including:

- Historical data from 1965 for many sections.
- Additional data for natural gas, coal, hydroelectricity, nuclear energy, electricity and renewables.
- PDF versions and PowerPoint slide packs of the charts, maps and graphs, plus an Excel workbook of the data.
- Regional and country factsheets.
- Videos and speeches.

### Download the BP World Energy app

Explore the world of energy from your tablet.  
Customize charts and perform the calculations.  
Review the data online and offline.  
Available in Apple App Store and Google play store.

### Other features include:

#### Charting tool

You can view predetermined reports or chart specific data according to energy type, region and year.

[bp.com/statisticalreview](http://bp.com/statisticalreview)

### Disclaimer

The data series for proved oil and gas reserves in *BP Statistical Review of World Energy June 2015* does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance, as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country. Rather, the data series has been compiled using a combination of primary official sources and third-party data.

# Group chief executive's introduction

## Energy in 2014 – A year of change in the energy landscape.

Welcome to the *BP Statistical Review of World Energy*. This 64th edition records the data for 2014, a remarkable year in the world of energy.

The eerie calm that had characterized energy markets in the few years prior to 2014 came to an abrupt end last year. However, we should not be surprised or alarmed. Indeed, to someone who has worked in the energy business for over 30 years, the volatility and uncertainty that characterized 2014 felt like a return to more normal conditions.

But neither should the events of 2014 be dismissed as just another bout of cyclical instability. Rather, they may well come to be viewed as symptomatic of a broader shifting in some of the tectonic plates that make up the energy landscape, with significant developments in both the supply of energy and its demand. Those developments had profound implications for prices, for the fuel mix, and for carbon emissions.

To understand those developments and consider their likely implications, we need timely and reliable data: that is where BP's Statistical Review comes in with its mission to provide objective, global data to inform discussion, debate and decision-making. This record of the global energy picture in 2014, together with the historical data, helps us understand how the world around us is changing and what that might bode for the future.

The most significant development on the supply side in 2014 was undoubtedly the continuing revolution in US shale. The US recorded the largest increase in oil production in the world, becoming the first country ever to increase average annual production by at least 1 million barrels per day for three consecutive years. The US replaced Saudi Arabia as the world's largest oil producer – a prospect unthinkable a decade ago. The growth in US shale gas in recent years has been just as startling, with the US overtaking Russia as the world's largest producer of oil and gas.

The developments on the demand side were no less striking as the growth in energy demand slowed sharply. Global primary energy consumption increased by just 0.9% in 2014, its slowest rate of growth since the late 1990s, other than immediately after the financial crisis. This slowing was driven in part by the rebalancing of the Chinese economy away from energy intensive sectors causing the growth of energy consumption in China to slow to its lowest rate since 1998. Even so, China remained the world's largest growth market for energy.

As we have seen, these shifts in supply and demand had major effects on energy prices, particularly oil prices. The fall in oil prices looks

to have been largely driven by the strength of supply as non-OPEC production grew by a record amount and OPEC maintained its production levels in order to protect its market share.

These developments also had important implications for the fuel mix. The slowing pace of Chinese industrialization caused the growth in Chinese coal consumption to stall and the growth in global consumption of coal to be unusually weak. Global growth in natural gas was also weak, held back by the mild European winter triggering a sharp fall in European gas consumption. Renewables were again the fastest growing form of energy and, in a year when global consumption growth slowed sharply, they accounted for one-third of the increase in total primary energy use. Renewables provided around 3% of the world's energy needs.

The deceleration in global energy demand and shift in the fuel mix had a marked impact on carbon emissions. Our calculations suggest that global CO<sub>2</sub> emissions from energy use grew by just 0.5% in 2014, the weakest since 1998, other than in the immediate aftermath of the financial crisis.

So it was a year of great change and our task as an industry is to respond in such a way as to meet today's challenges while continuing to invest to meet tomorrow's demand, safely and sustainably. In BP we are responding by exerting discipline over capital and costs, driving the efficient use of energy in our operations and products. At the same time we are forging ahead with investments that will deliver energy to customers and value to shareholders over the long term. These choices involve fine judgements that can be more confidently made when based on the kind of solid data and analysis provided by this Review. I hope you will find it a useful resource in your own work.

Let me conclude by thanking BP's economics team, led by our chief economist, Spencer Dale, and all those around the world who helped us prepare this Review – in particular those in governments who have contributed their official data.

**Bob Dudley**  
Group chief executive  
June 2015

# 2014 in review

Global primary energy consumption decelerated sharply in 2014, even though global economic growth was similar to 2013.

▲ The Oriental Pearl TV and radio tower lights up the Shanghai sky at night.

▼ Mumbai, the capital of the Indian state of Maharashtra, is one of the largest and most densely populated cities in the world.

Consumption increased for all fuels, reaching record levels for every fuel type except nuclear power; production increased for all fuels except coal. For oil and natural gas, global consumption growth was weaker than production. The data suggest that global CO<sub>2</sub> emissions from energy grew at their slowest rate since 1998, other than in the immediate aftermath of the financial crisis.

Emerging economies accounted for all of the net growth in energy consumption, as they have on average over the past decade, although growth in these countries was well below its 10-year average. Chinese consumption growth was the slowest since 1998, yet China still recorded the world's largest increment in primary energy consumption for the fourteenth consecutive year. OECD consumption experienced a larger than average decline, with weakness in the EU and Japan offsetting above average growth in the US. Energy consumption in the EU fell to its lowest level since 1985.

Energy price developments in 2014 were generally weak, with oil and coal prices falling globally. Gas prices fell in Europe, were relatively flat in Asia, and rose in North America. The annual average price for Brent, the international crude oil benchmark, declined reflecting a sharp fall in prices in the second half of the year. The differential between Brent and the US benchmark West Texas Intermediate (WTI) narrowed but remained elevated relative to past levels. As with crude oil prices, differentials between

North American and international gas prices generally narrowed but remained wider than historical levels.

## Energy developments

Global primary energy consumption increased by just 0.9% in 2014, a marked deceleration over 2013 (+2.0%) and well below the 10-year average of 2.1%. Growth in 2014 slowed for every fuel other than nuclear power, which was also the only fuel to grow at an above-average rate. Growth was significantly below the 10-year average for Asia Pacific, Europe & Eurasia, and South & Central America. Oil remained the world's leading fuel, with 32.6% of global energy consumption, but lost market share for the fifteenth consecutive year.

Although emerging economies continued to dominate the growth in global energy consumption, growth in these countries (+2.4%) was well below its 10-year average of 4.2%. China (+2.6%) and India (+7.1%) recorded the largest national increments to global energy consumption. OECD consumption fell by 0.9%, which was a larger fall than the recent historical average. A second consecutive year of robust US growth (+1.2%) was more than offset by declines in energy consumption in the EU (-3.9%) and Japan (-3.0%). The fall in EU energy consumption was the second-largest percentage decline on record (exceeded only in the aftermath of the financial crisis in 2009).

**+0.9%**

Growth in global primary energy consumption, the weakest since 2009.

▲ Newly constructed steam generators at Sunrise in the Canadian oil sands of Northern Alberta help to access the area's bitumen resources while minimizing land disturbance.

▼ A support vessel alongside the Na Kika oil and natural gas production platform in the US Gulf of Mexico.

### Prices

Dated Brent averaged \$98.95 per barrel in 2014, a decline of \$9.71 per barrel from the 2013 level and the first annual average below \$100 since 2010. Crude oil prices remained firm in early 2014 in the face of continued large supply disruptions, but fell sharply later in the year due to strong non-OPEC production growth combined with weaker consumption growth (relative to 2013) and OPEC's November decision to defend market share. The WTI – Brent differential narrowed to \$5.66 per barrel despite continued robust US production growth.

### Consumption and production

Global oil consumption grew by 0.8 million barrels per day (b/d), or 0.8% – a little below its recent historical average and significantly weaker than the increase of 1.4 million b/d seen in 2013. Countries outside the OECD once again accounted for all of the net growth in global consumption. OECD consumption declined by 1.2%, the eighth decrease in the past nine years. Chinese consumption growth was below average but still recorded the largest increment to global oil consumption (+390,000 b/d); Japan recorded the largest decline (-220,000 b/d), with Japanese oil consumption falling to its lowest level since 1971. Light distillates were the fastest growing refined product category for a second consecutive year.

Global oil production growth was more than double that of global consumption, rising by 2.1 million b/d or 2.3%. Production outside OPEC grew by 2.1 million b/d, the largest increase in our dataset. The US (+1.6 million b/d) recorded the largest growth in the world, becoming the first country ever to increase production

by at least 1 million b/d for three consecutive years, and taking over from Saudi Arabia as the world's largest oil producer. Along with the US, production in Canada (+310,000 b/d) and Brazil (+230,000 b/d) also reached record levels in 2014. OPEC output was flat, and the group's share of global production fell to 41%, its lowest since 2003. Declines in Libya (-490,000 b/d) and Angola (-90,000 b/d) were offset by gains in Iraq (+140,000 b/d), Saudi Arabia (+110,000 b/d) and Iran (+90,000 b/d).

### Refining and trade

Global crude runs rose by 1.1 million b/d (+1.4%) in 2014 – the highest growth since 2010 and more than double the 10-year average. Strong growth in the US, China and the Middle East outweighed declines in Europe and OECD Asia Pacific. Refinery runs in the US rose by 530,000 b/d, the largest increase since 1986. Global refining capacity expanded by an above average 1.3 million b/d, led by additions in China and the Middle East, with Middle Eastern capacity expanding by a record 740,000 b/d. Global refinery utilization remained at 79.6%, its lowest rate since 1987.

Global trade of crude oil and refined products in 2014 grew by a below average 0.9%, or 490,000 b/d. Import growth was driven by China and other emerging economies, while US net imports declined. China replaced the US as the world's largest net oil importer in 2013. Gross exports from North Africa declined by 17.1%, or 360,000 b/d, primarily due to lower Libyan crude production, however this was outweighed by a 530,000 b/d increase in US (gross) exports as rising refinery runs lifted product exports.

## +1.6m b/d

Growth of US oil production, making it the world's largest producer.

## 7.3m b/d

Reduction in US net oil imports since 2005.

# ④ Natural gas

**-11.6%**

Decline in EU gas consumption,  
its largest decline on record.

**-3.4%**

Decline in global gas trade.

## Consumption and production

World natural gas consumption grew by just 0.4%, well below the 10-year average of 2.4%. Growth was below average in both the OECD and emerging economies, with consumption in the EU (-11.6%) experiencing its largest volumetric and percentage declines on record. The Europe & Eurasia region (-4.8%) had the five largest volumetric declines in the world in Germany, Italy, the Ukraine, France and the UK. The US (+2.9%), China (+8.6%) and Iran (+6.8%) recorded the largest growth increments. Globally, natural gas accounted for 23.7% of primary energy consumption.

Global natural gas production grew by 1.6%, below its 10-year average of 2.5%. Growth was below average in all regions except North America. EU production fell sharply (-9.8%) to its lowest level since 1971. The US (+6.1%) recorded the world's largest increase, accounting for 77% of net global growth. The largest volumetric declines were seen in Russia (-4.3%) and the Netherlands (-18.7%).

## Trade

Global natural gas trade registered a rare contraction in 2014, falling by 3.4%. Pipeline shipments declined by 6.2%, the largest decline on record, driven by falls in net pipeline exports from Russia (-11.8%) and the Netherlands (-29.9%). The UK (-28.2%), Germany (-10.1%) and the Ukraine (-29.9%) all reduced their net pipeline imports markedly. Global LNG trade increased by 2.4%. Higher imports by China (+10.8%) and the UK (+20.1%) were partly offset by declines in South Korea (-6.0%) and Spain (-15.7%). International natural gas trade accounted for 29.4% of global consumption; LNG's share of global gas trade rose to 33.4%.

▼ Drilling for gas at the East Texas basin, one of North America's most prolific oil and gas production areas.

▲ Pipelines at the Durango gas field, located in the San Juan Basin of Colorado.

# Other fuels

▲ Harvesting sugar cane for biofuels in Ituiutaba, Brazil.

► Above the Gudbrandsdalslågen river the 280 metre dam serves the Hunderfossen hydroelectric power station.

**+0.4%**

Growth in global coal consumption.

**4.4%**

The share of nuclear power in the world's primary energy mix.

**6.0%**

Share of global power generation met by renewables.

## In detail

Additional information – including historical time series for the fuels reported in this review; further detail on renewable forms of energy; electricity generation; and CO<sub>2</sub> emissions from energy use – is available at [bp.com/statisticalreview](http://bp.com/statisticalreview)

## Coal

Global coal consumption grew by 0.4% in 2014, well below the 10-year average annual growth of 2.9%.

Coal's share of global primary energy consumption fell to 30.0%. Consumption outside the OECD grew by 1.1%, the weakest growth since 1998, driven by a flattening of Chinese consumption (+0.1%). Ukraine (-20.2%) and the UK (-20.3%) posted significant declines. India (+11.1%) experienced its largest volumetric increase on record, and the world's largest volumetric increase. OECD consumption fell by 1.5%, led by a 6.5% decline in the EU. Global coal production fell by 0.7%, with large declines in China (-2.6%, the world's largest volumetric decline) and Ukraine (-29.0%) more than offsetting large increases in India (+6.4%) and Australia (+4.7%).

## Nuclear and hydroelectric

Global nuclear output grew by an above-average 1.8%, the second consecutive annual increase, and the first time nuclear power has gained global market share since 2009. Increases in South Korea, China and France outpaced declines in Japan, Belgium and the UK. Japanese nuclear power output ceased in 2014 as the country's last operating reactor was taken off line.

Global hydroelectric output grew by a below average 2.0%. Growth in the Asia Pacific region offset drought-driven declines in the Western

Hemisphere and Europe & Eurasia. Chinese hydroelectric output grew by 15.7% and accounted for all of the net increase in global output. Drought conditions reduced output in Brazil by 5.5% and in Turkey by 32%. Hydroelectric output accounted for a record 6.8% of global primary energy consumption.

## Renewables

Renewable energy sources – in power generation as well as transport – continued to increase in 2014, reaching a record 3.0% of global energy consumption, up from 0.9% a decade ago. Renewable energy used in power generation grew by 12.0%. Although this increase was below its 10-year average, it meant that renewables accounted for a record 6.0% of global power generation. China recorded the largest increment in renewables in power generation for a fifth consecutive year; growth last year (+15.1%) was one-third the 10-year average. Globally, wind energy (+10.2%, +14.8 million tonnes of oil equivalent, mtoe) grew by less than half of its 10-year average, with below average growth in all regions except Africa and South & Central America (which combined accounted for less than 4% of global output). Solar power generation grew by 38.2% (+11.6 mtoe). Global biofuels production grew by a below-average 7.4% (+4.9 mtoe), driven by increases in the US (+5.6%), Brazil (+5.5%), Indonesia (+40.4%) and Argentina (+30.9%).

## Acknowledgements

We would like to express our sincere gratitude to the many contacts worldwide who provide the publicly available data for this publication, and to the researchers at the Centre for Energy Economics Research and Policy, Heriot-Watt University who assist in the data compilation.

#Excludes Estonia and Latvia in 1994.

**Notes:** Total proved reserves of oil – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. The data series for proved oil reserves does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country.

Reserves-to-production (R/P) ratio – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Source of data – The estimates in this table have been compiled using a combination of primary official sources, third-party data from the OPEC Secretariat, World Oil, Oil & Gas Journal and independent estimates of Russian reserves based on official data and Chinese reserves based on information in the public domain. Canadian oil sands 'under active development' are an official estimate. Venezuelan Orinoco Belt reserves are based on the OPEC Secretariat and government announcements.

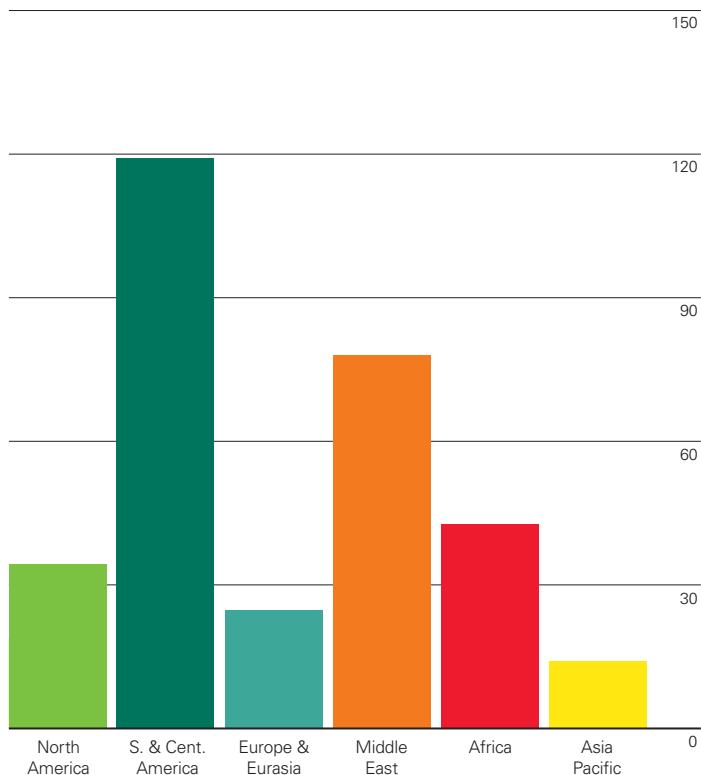

Reserves include gas condensate and natural gas liquids (NGLs) as well as crude oil.

Shares of total and R/P ratios are calculated using thousand million barrels figures.

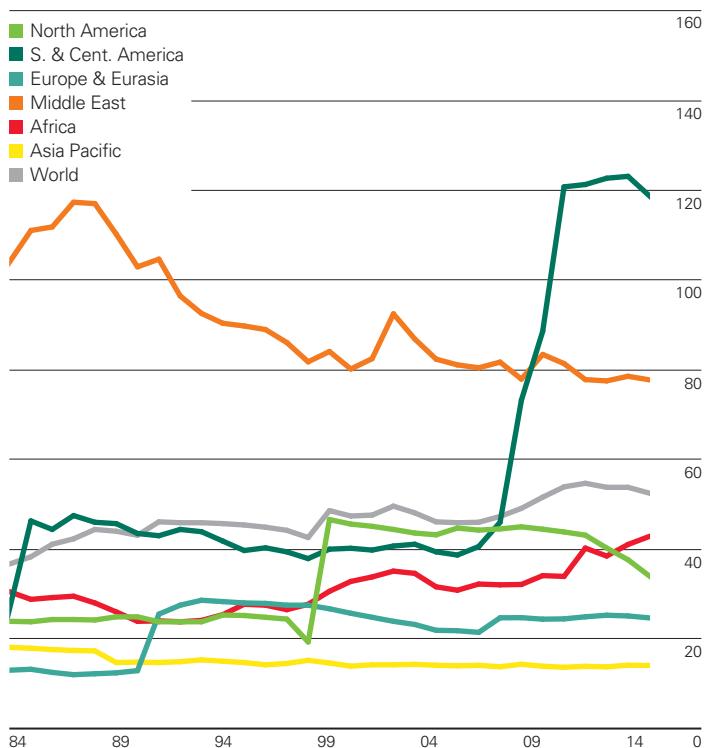

## Reserves-to-production (R/P) ratios

Years

### 2014 by region

### History

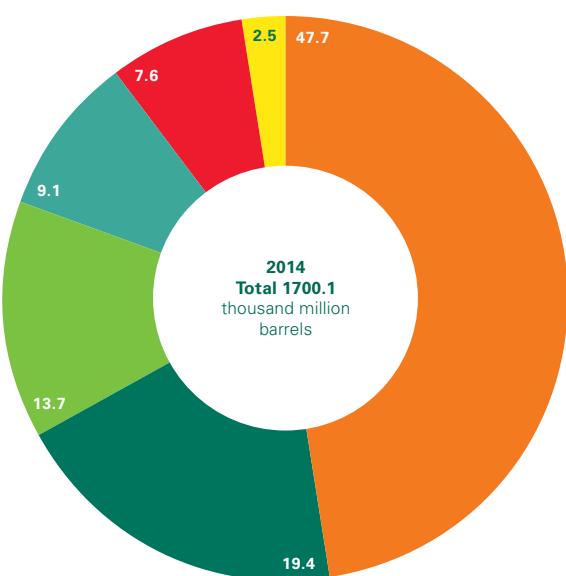

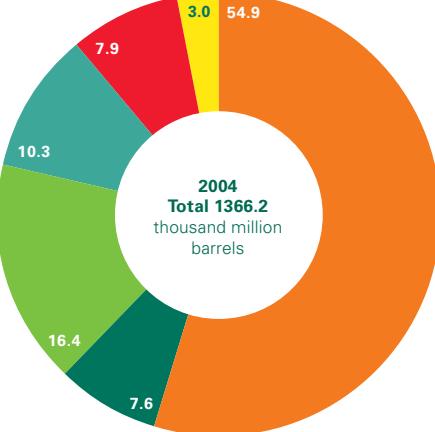

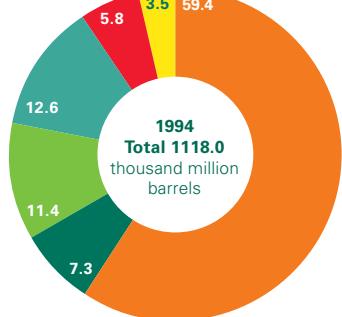

Total world proved oil reserves reached 1700.1 billion barrels at the end of 2014, sufficient to meet 52.5 years of global production. The largest addition to reserves came from Saudi Arabia, adding 1.1 billion barrels. The largest decline came from Russia, where reserves fell by 1.9 billion barrels. OPEC countries continue to hold the majority of the world's reserves, accounting for 71.6% of the global total. South & Central America continues to hold the highest R/P ratio, more than 100 years. Over the past decade, global proved reserves have increased by 24%, or more than 330 billion barrels.

### Distribution of proved reserves in 1994, 2004 and 2014

Percentage

- Middle East
- S. & Cent. America
- North America
- Europe & Eurasia
- Africa
- Asia Pacific

\*Includes crude oil, shale oil, oil sands and NGLs (natural gas liquids – the liquid content of natural gas where this is recovered separately). Excludes liquid fuels from other sources such as biomass and derivatives of coal and natural gas.

†Less than 0.05%.

‡Excludes Former Soviet Union.

Note: Annual changes and shares of total are calculated using million tonnes per annum figures.

## Production by region

Million barrels daily

## Consumption by region

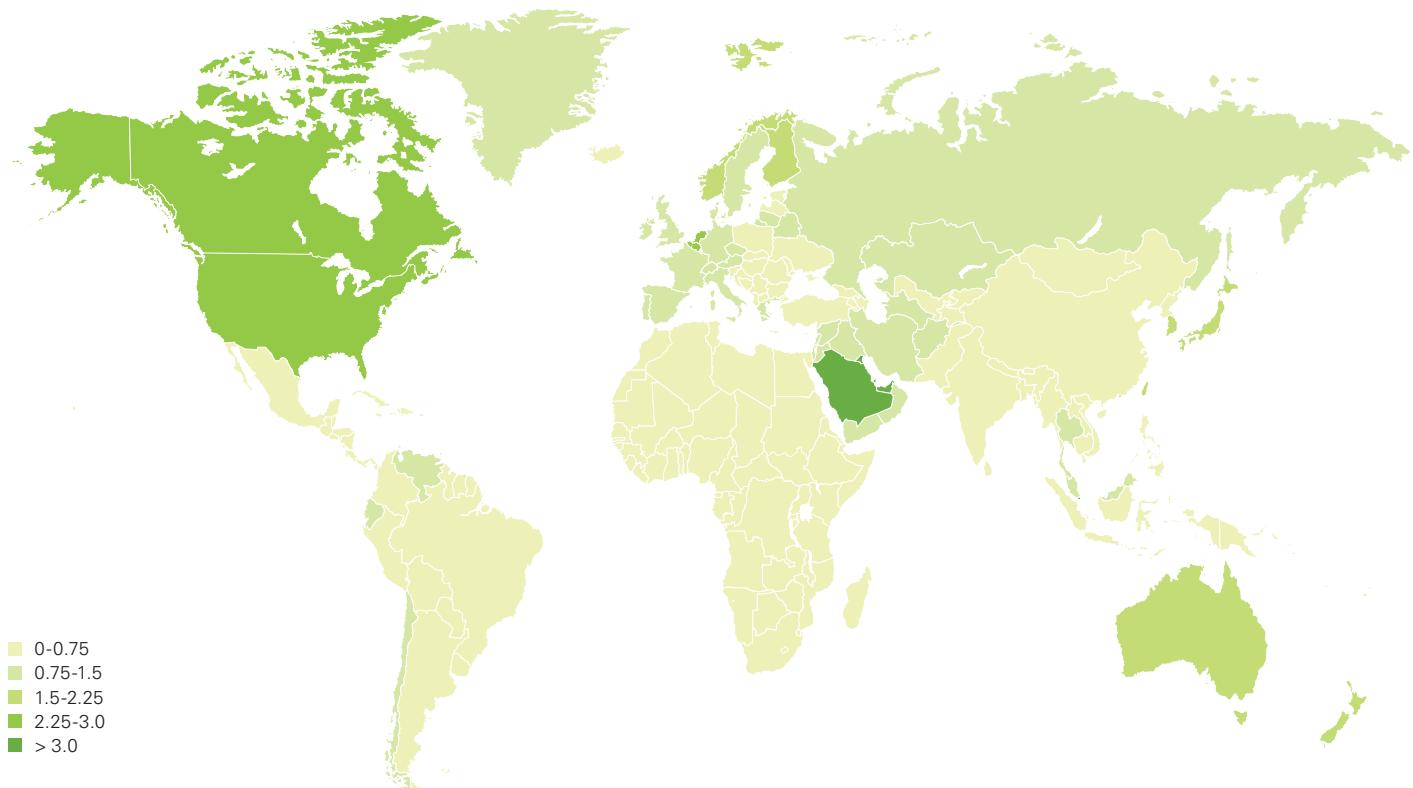

Million barrels daily

World oil production significantly outpaced consumption in 2014, rising by 2.1 million b/d; all of the growth was in non-OPEC countries, which recorded a record increase. US output grew by 1.6 million b/d, its largest increase on record. OPEC production was essentially flat, with declines among African OPEC producers offset by rising Middle East output. Global consumption increased by 840,000 b/d, with emerging economies accounting for all of the growth; China saw a below-average increase but still accounted for the largest increment to consumption.

## Refinery utilization

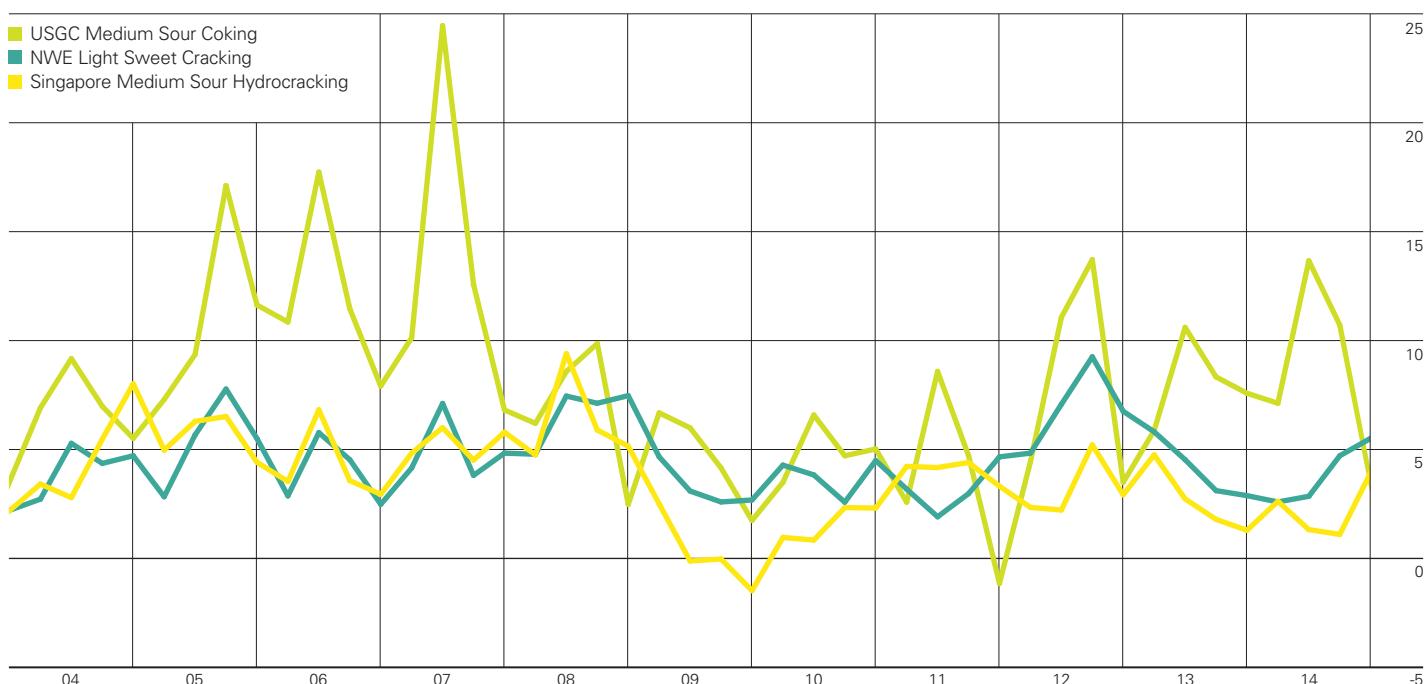

Percentage

Global crude runs rose by 1.1 million b/d in 2014, with growth in the US, China and the Middle East outweighing declines in Europe and OECD Asia Pacific. The US recorded its largest increase in crude runs since 1986. Global refining capacity expanded by 1.3 million b/d, led by China and record growth in the Middle East. Global average refinery utilization remained at 79.6%, the lowest since 1987.

## Regional refining margins

US dollars per barrel

**Note:** The refining margins presented are benchmark margins for three major global refining centres: US Gulf Coast (USGC), North West Europe (NWE – Rotterdam) and Singapore. In each case they are based on a single crude oil appropriate for that region and have optimized product yields based on a generic refinery configuration (cracking, hydrocracking or coking), again appropriate for that region. The margins are on a semi-variable basis, i.e. the margin after all variable costs and fixed energy costs.

n/a not available.

**Notes:** Total proved reserves of natural gas – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. The data series for proved natural gas reserves does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country.

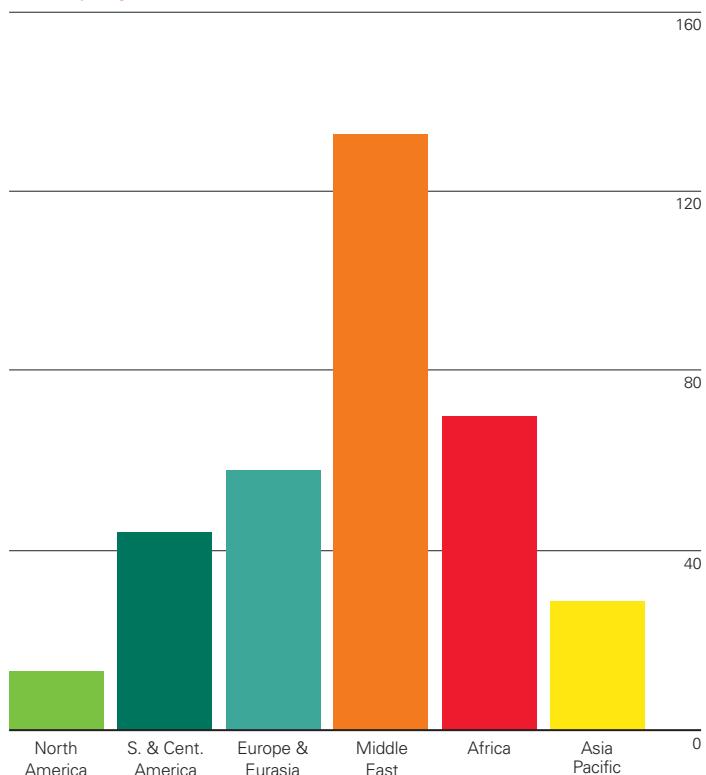

**Reserves-to-production (R/P) ratio** – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

**Source of data** – The estimates in this table have been compiled using a combination of primary official sources and third-party data from Cedigaz and the OPEC Secretariat.

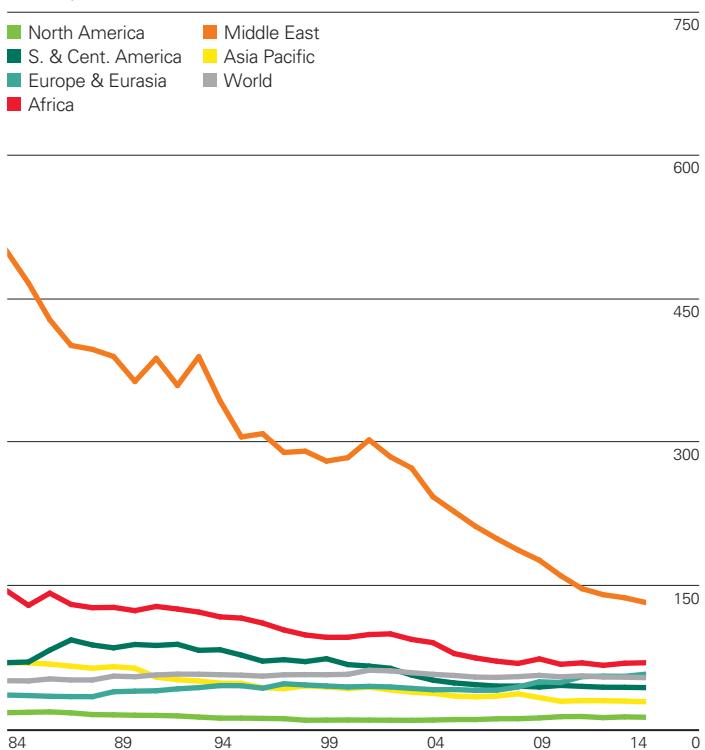

## Reserves-to-production (R/P) ratios

Years

### 2014 by region

### History

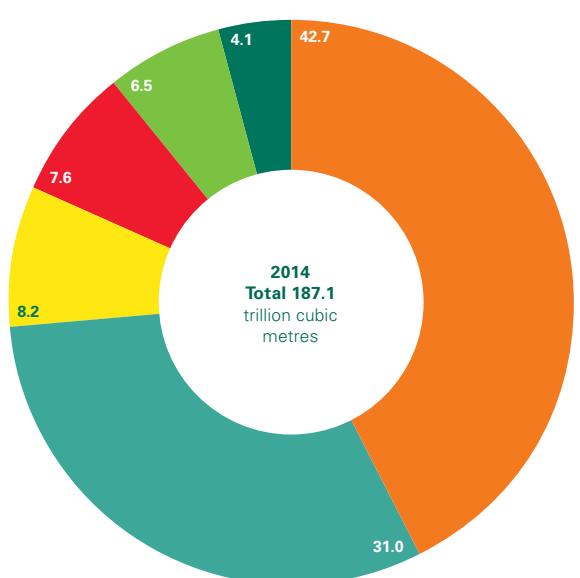

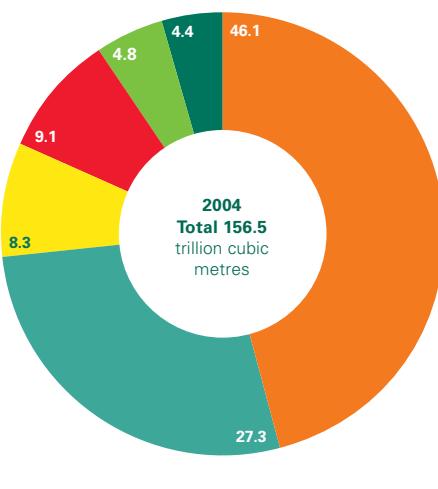

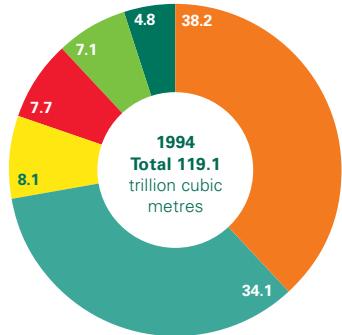

World proven natural gas reserves at end-2014 stood at 187.1 trillion cubic metres (tcm), sufficient to meet 54.1 years of global production. Proved reserves grew by 0.3% relative to end-2013. Growth in Russia (+0.4 tcm), Azerbaijan (+0.3 tcm) and the US (+0.2 tcm) accounted for all of the gross increase in global proved reserves in 2014. Iran (34.0 tcm) and Russia (32.6 tcm) hold the largest proved reserves.

### Distribution of proved reserves in 1994, 2004 and 2014

Percentage

- Middle East
- Europe & Eurasia
- Asia Pacific
- Africa
- North America

\*Excludes gas flared or recycled. Includes natural gas produced for Gas-to-Liquids transformation.

Source: Includes data from Cedigaz.

♦Less than 0.05%.

**Notes:** As far as possible, the data above represents standard cubic metres (measured at 15°C and 1013 mbar); as they are derived directly from tonnes of oil equivalent using an average conversion factor, they do not necessarily equate with gas volumes expressed in specific national terms.

**Annual changes and shares of total are calculated using million tonnes of oil equivalent figures.**

Natural gas production data expressed in billion cubic feet per day is available at [bp.com/statisticalreview](http://bp.com/statisticalreview)

## Production by region

Billion cubic metres

## Consumption by region

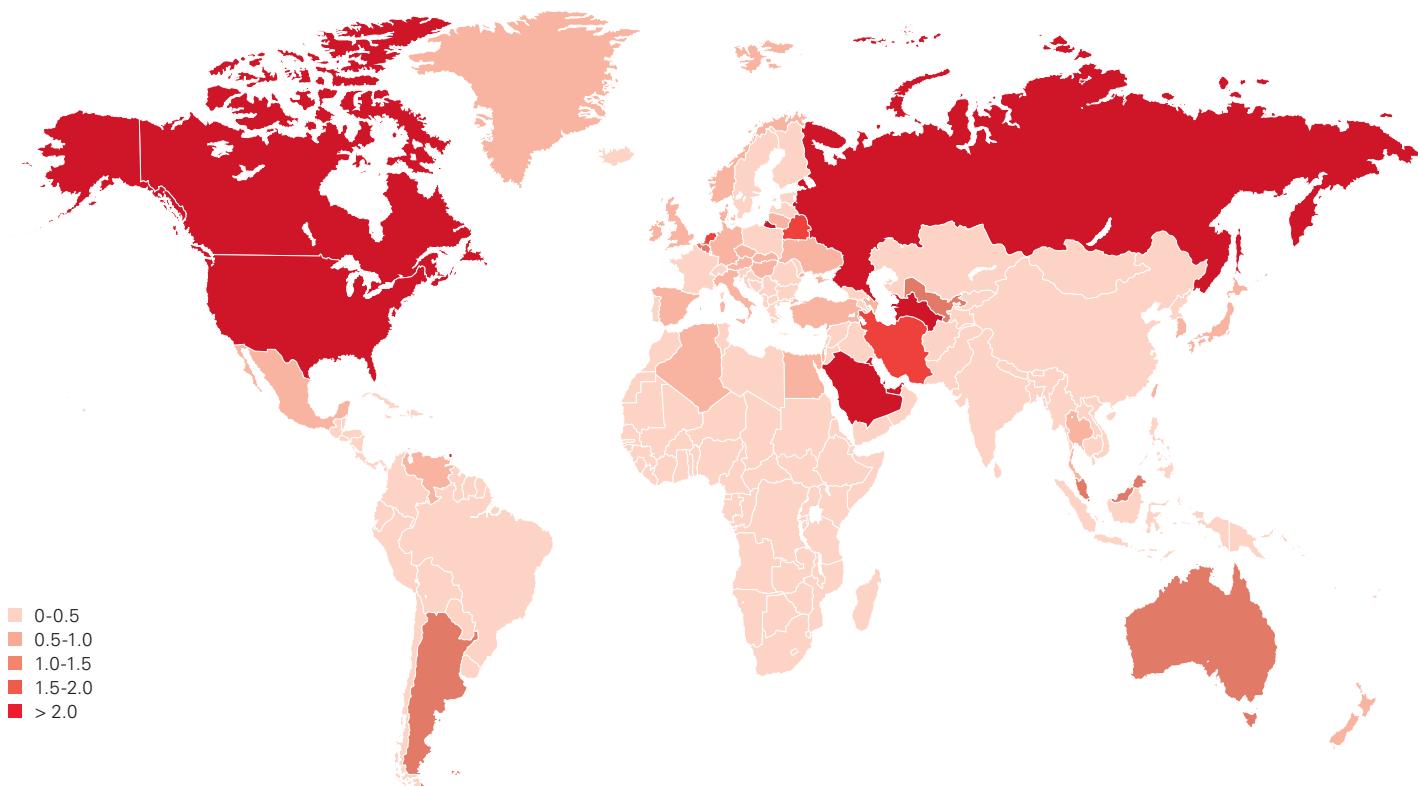

Billion cubic metres

World natural gas production increased by 1.6% in 2014, four times the growth rate of global consumption (+0.4%). Production growth was below average in all regions except North America. The US (+6.1%) recorded the largest growth increment while Russia had the largest decline (-4.3%). Consumption growth was below average in all regions except North America and the Middle East. The US (+2.9%) recorded the largest growth in consumption in the world while the EU had the biggest decline on record (-11.6%).

## Consumption per capita 2014

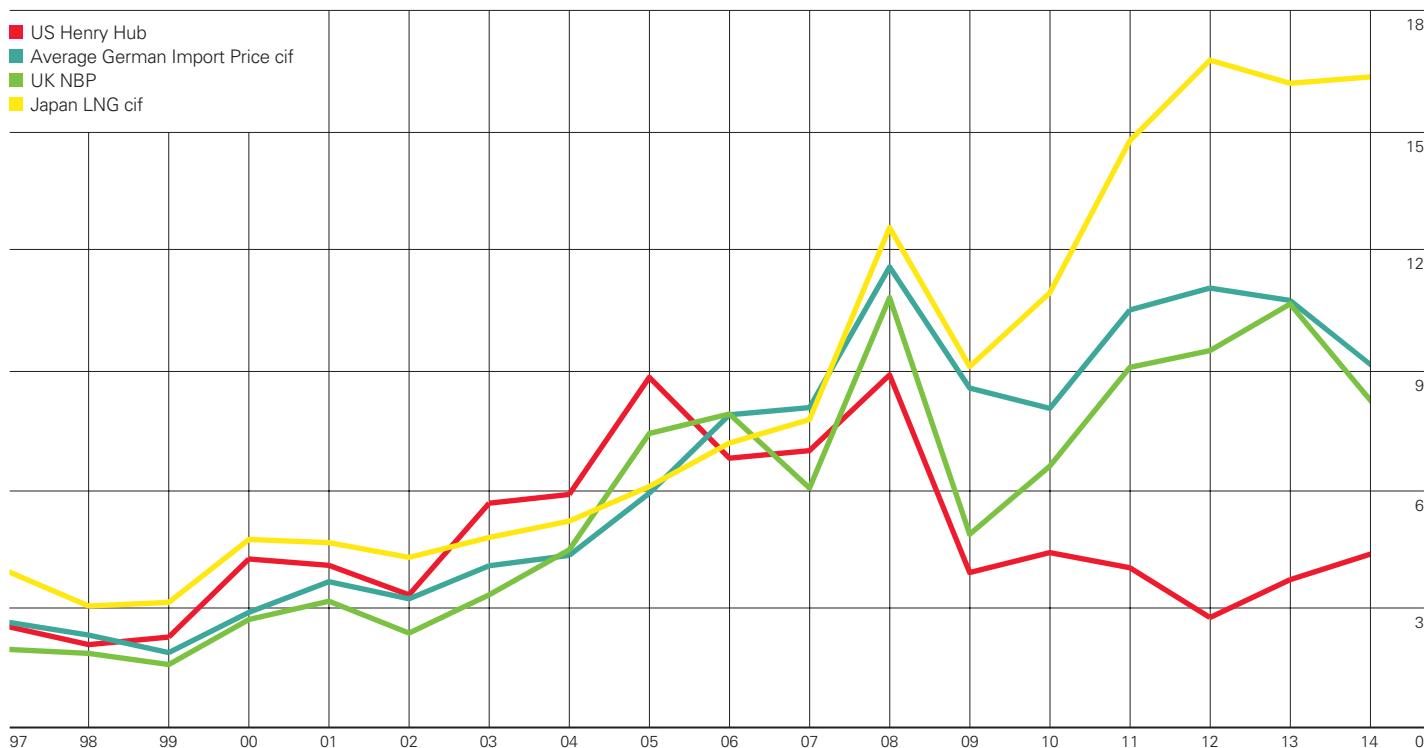

Tonnes oil equivalent

**Notes:** Total proved reserves of coal – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known deposits under existing economic and operating conditions. The data series for proved coal reserves does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country.

**Reserves-to-production (R/P) ratio** – If the reserves remaining at the end of the year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Reserves-to-production (R/P) ratios are calculated excluding other solid fuels production.

Source of reserves data: World Energy Resources 2013 Survey, World Energy Council.

Note: cif = cost+insurance+freight (average prices); fob = free on board.

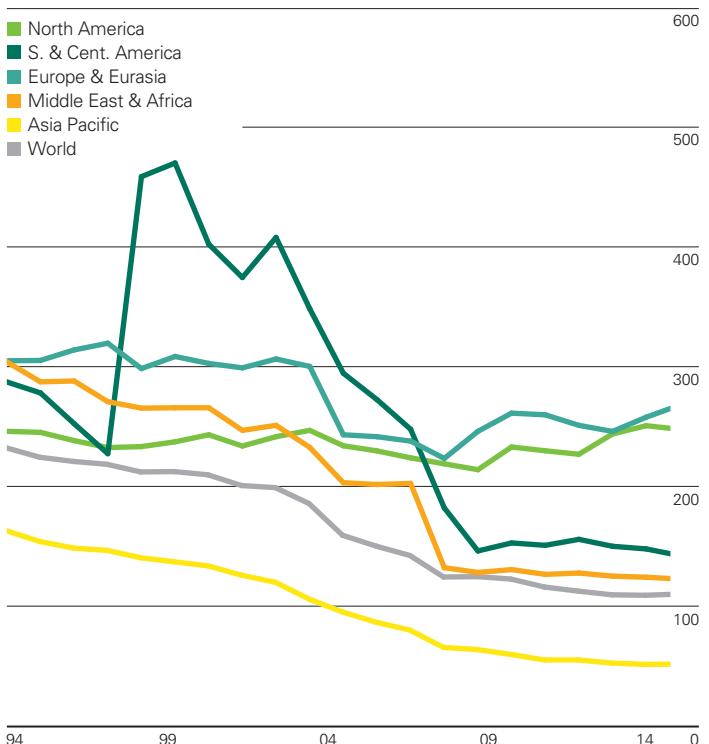

## Reserves-to-production (R/P) ratios

Years

2014 by region

History

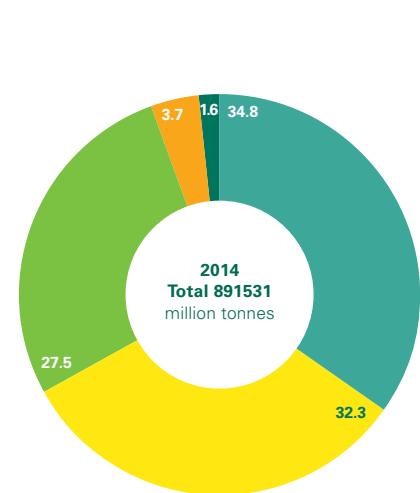

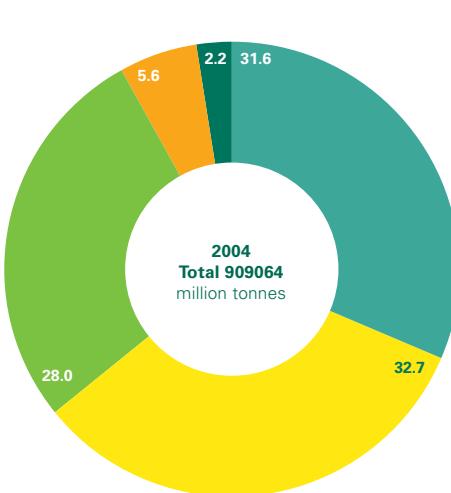

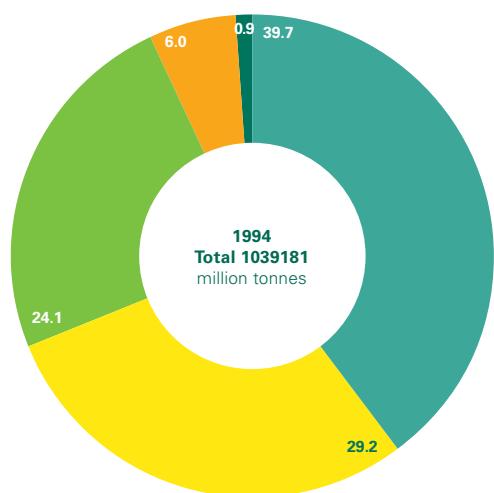

World proved coal reserves in 2014 were sufficient to meet 110 years of global production, by far the largest R/P ratio for any fossil fuel. By region, Europe & Eurasia holds the largest proved reserves and has the highest R/P ratio – 268 years, compared with 248 years for North America. The lowest R/P ratio is in the Asia Pacific region (51 years).

## Distribution of proved reserves in 1994, 2004 and 2014

Percentage

- Europe & Eurasia
- Asia Pacific
- North America
- Middle East & Africa
- S. & Cent. America

\*Commercial solid fuels only, i.e. bituminous coal and anthracite (hard coal), lignite and brown (sub-bituminous) coal, and other commercial solid fuels. Excludes coal converted to liquid or gaseous fuels, but includes coal consumed in transformation processes.

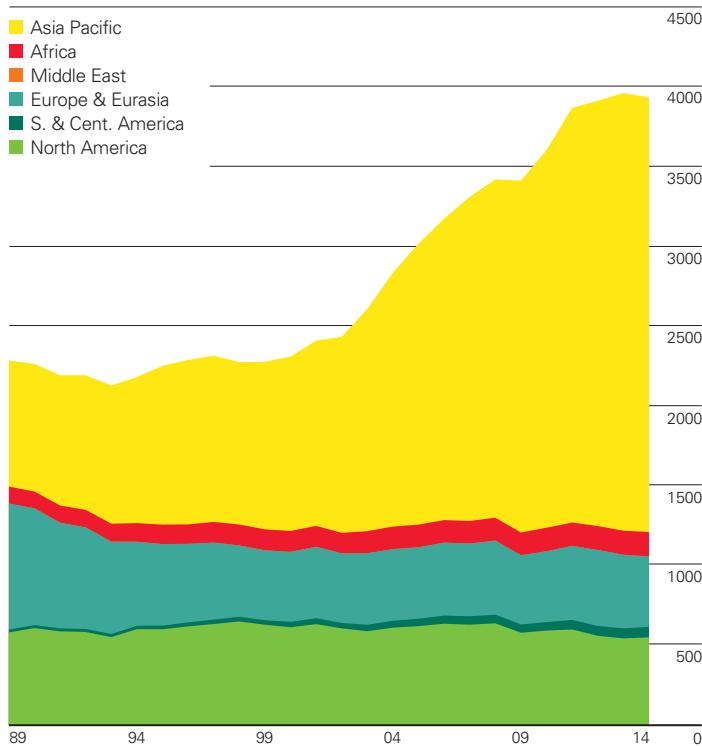

†Less than 0.05.

‡Less than 0.05%.

**Note:** Differences between these world consumption figures and the world production statistics are accounted for by stock changes, and unavoidable disparities in the definition, measurement or conversion of coal supply and demand data.

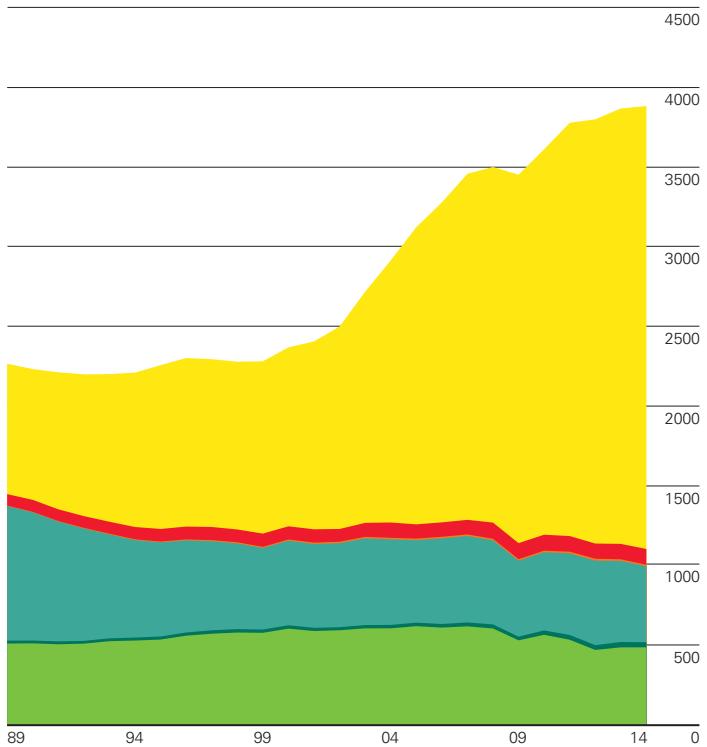

## Production by region

Million tonnes oil equivalent

## Consumption by region

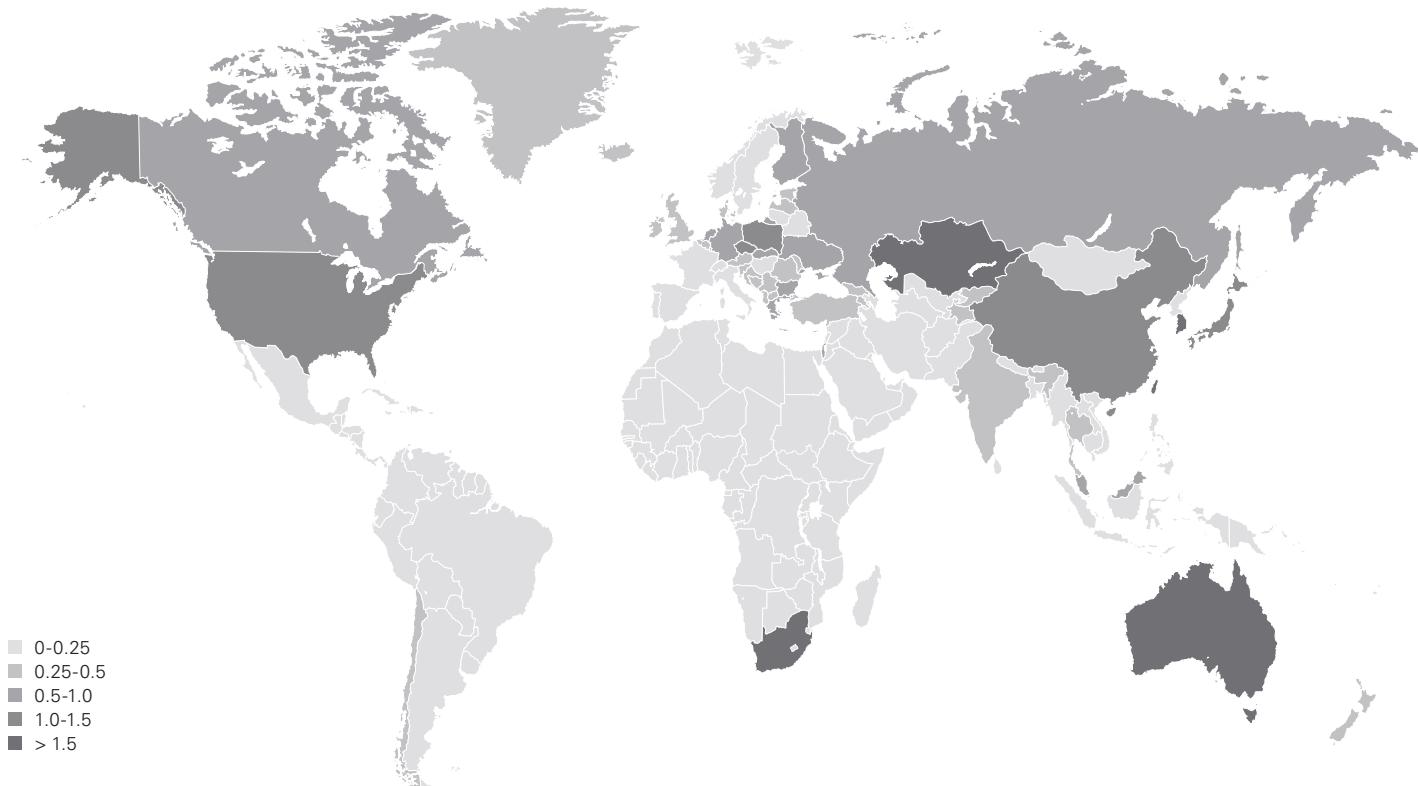

Million tonnes oil equivalent

World coal production declined by 0.7% in 2014, while consumption grew by 0.4%. India (+6.4%) recorded the largest production increment, while China contributed the biggest decline (-2.6%). India accounted for the largest increment to consumption (+11.1%) and Ukraine for the largest decline (-20.2%).

## Consumption per capita 2014

\*Based on gross primary generation and not accounting for cross-border electricity supply. Converted on the basis of thermal equivalence assuming 38% conversion efficiency in a modern thermal power station.

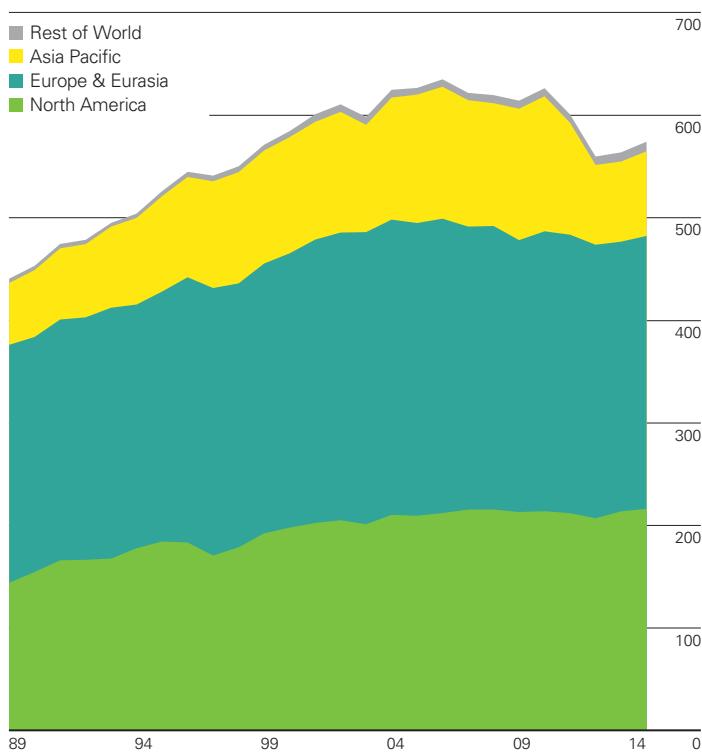

†Less than 0.05.

♦Less than 0.05%.

Note: Hydroelectricity data expressed in terawatt-hours is available at [bp.com/statisticalreview](http://bp.com/statisticalreview)

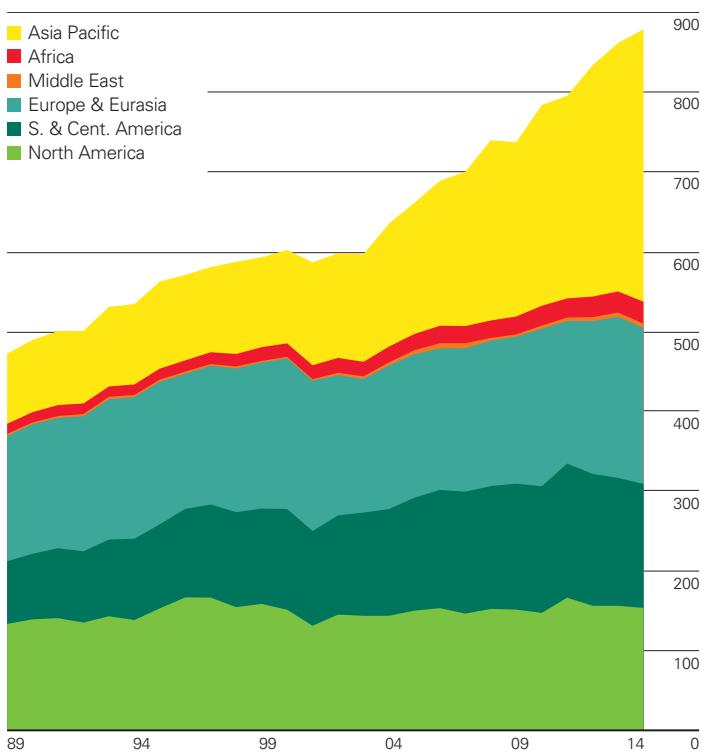

### Nuclear energy consumption by region

Million tonnes oil equivalent

### Hydroelectricity consumption by region

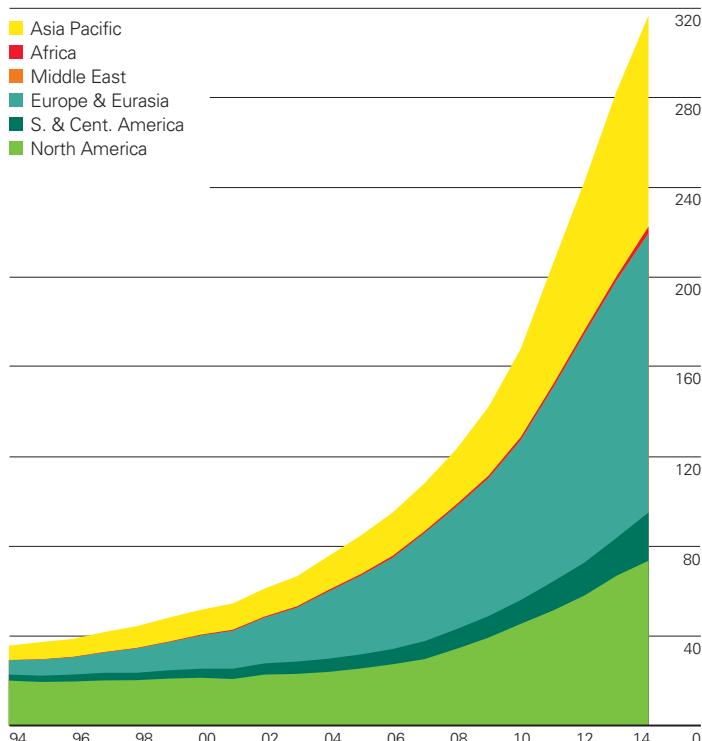

Million tonnes oil equivalent

World nuclear power generation increased by 1.8%, significantly faster than the 10-year average of -0.8%. Gains in South Korea, China, France and North America more than offset declines in Japan, Belgium and the UK. Global hydroelectric output grew by 2.0%. This was slower than the previous two years and below the 10-year average of 3.3%. Nearly all global growth came from China which grew 15.7%. This was partially offset by large declines in Brazil, Turkey, North America and Russia.

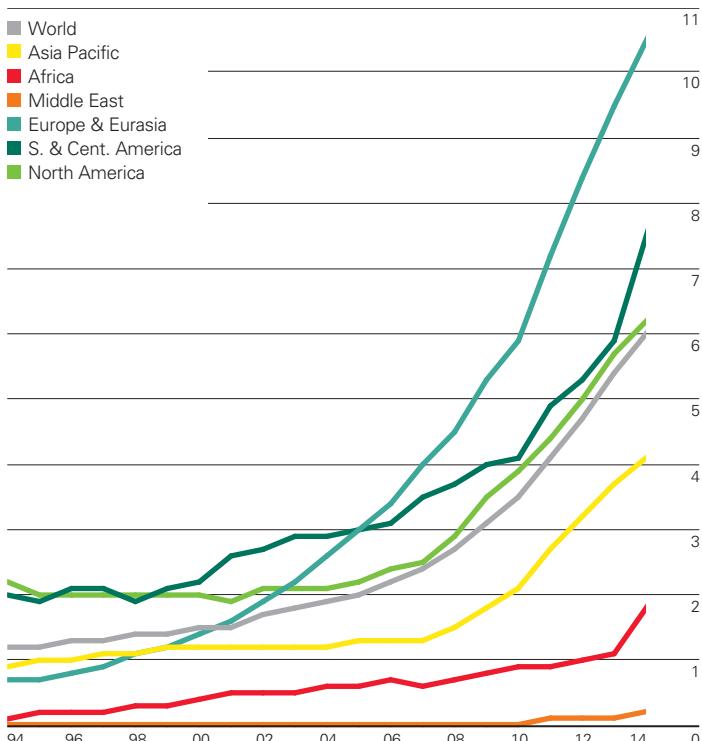

### Other renewables consumption by region

Million tonnes oil equivalent

### Other renewables share of power generation by region

Percentage

Renewable energy in power grew by 12.0%, the lowest rate of growth since 2006. Nevertheless renewables continued to increase their share of electricity production, accounting for 6.0% of global electricity. Asia Pacific contributed the largest growth increment, led by China, while Africa recorded the fastest growth rate. Europe & Eurasia continues to lead in terms of share of power generation, with non-hydro renewables now supplying nearly 17% of EU power generation.

## World biofuels production

Million tonnes oil equivalent

World biofuels production increased by 7.4% in 2014. Global ethanol production increased by 6.0%, the second consecutive year of growth, led by increases from North America, South & Central America and Asia Pacific. Biodiesel production increased by 10.3% in 2014, despite a decline in production from North America.

# ① Primary energy

## World consumption

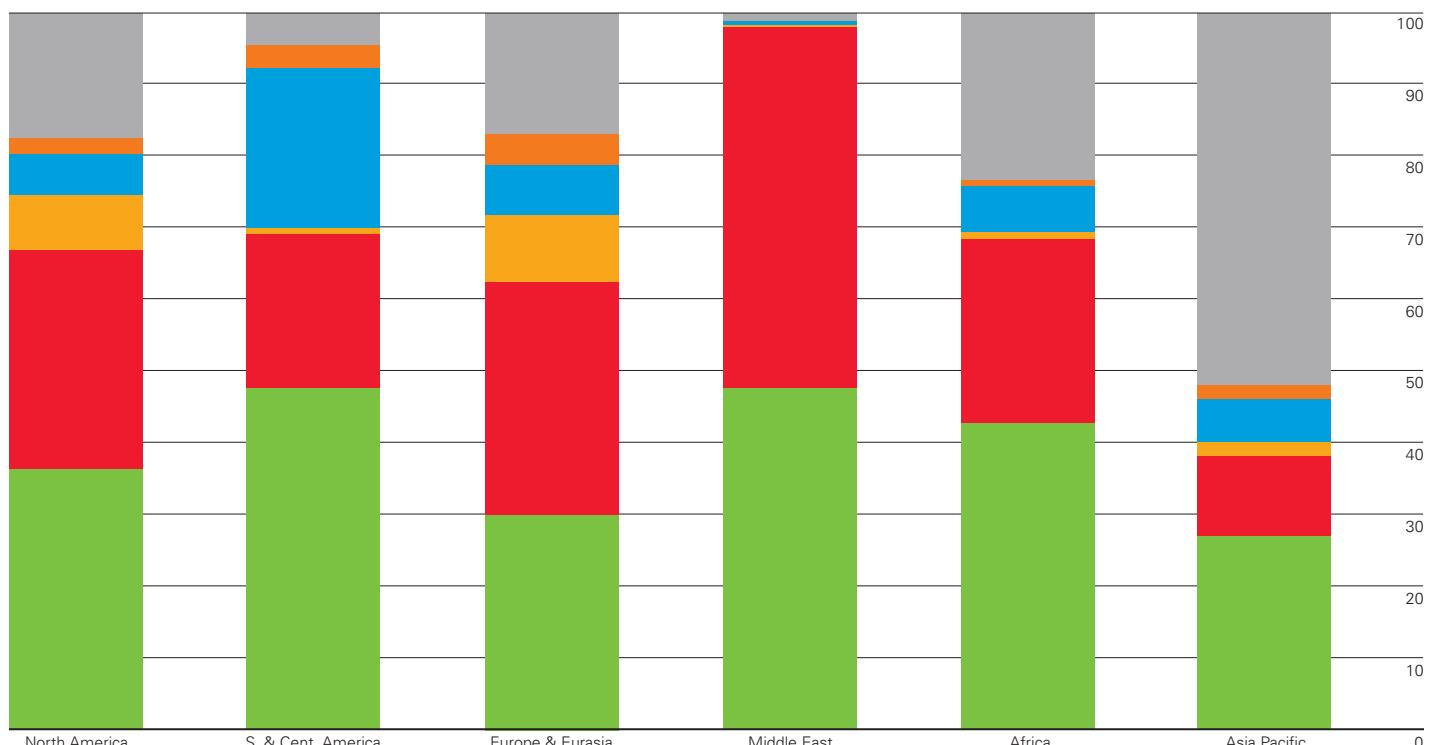

Million tonnes oil equivalent

World primary energy consumption grew by a below-average 0.9% in 2014, the slowest rate of growth since 1998 other than the decline in the aftermath of the financial crisis. Growth was below average in all regions except North America and Africa. All fuels except nuclear grew at below-average rates. Oil remains the world's dominant fuel. Hydroelectric and other renewables in power generation both reached record shares of global primary energy consumption (6.8% and 2.5%, respectively).

## Regional consumption pattern 2014

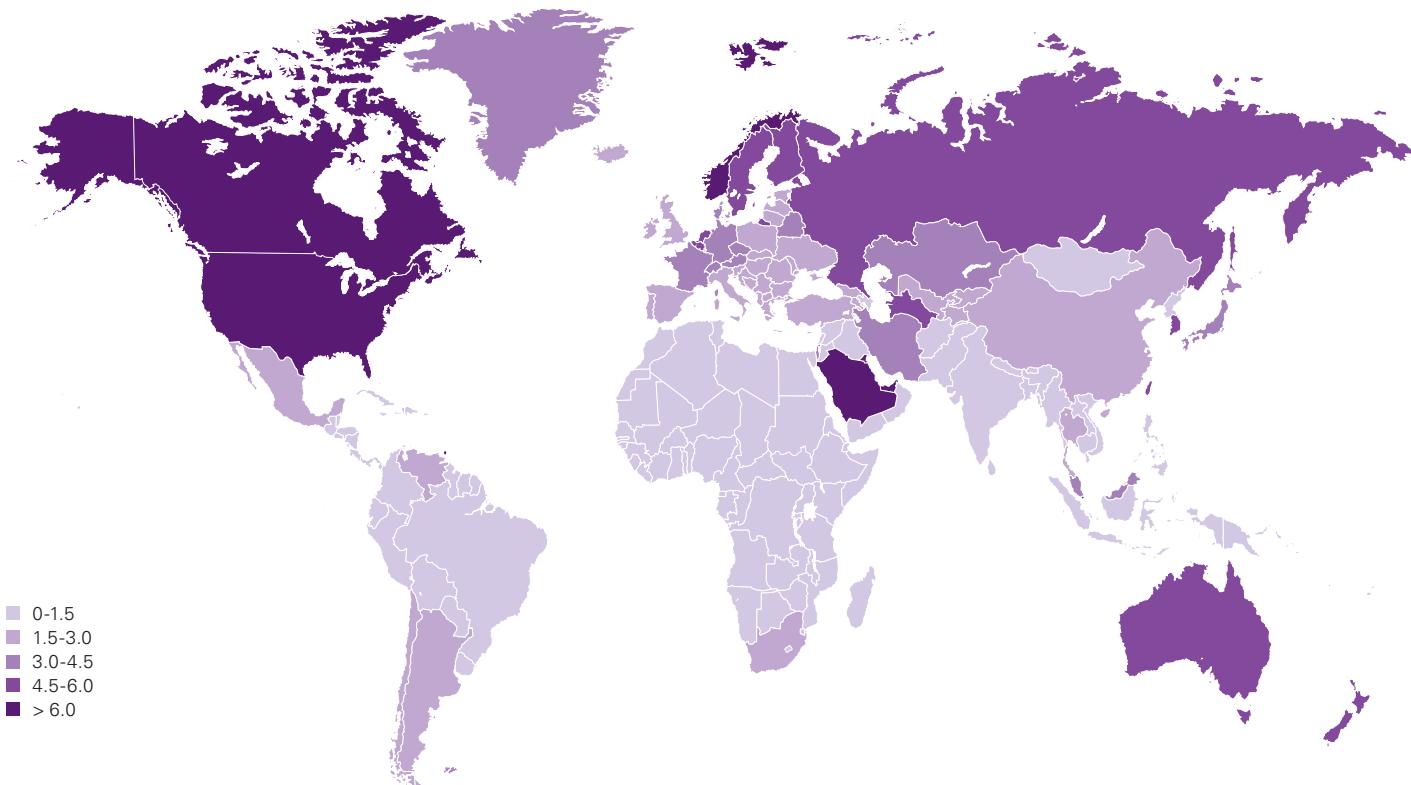

Percentage

The Asia Pacific region once again accounted for the largest increment to global primary energy consumption and continues to account for the largest share (41.3% of the global total). The region accounted for over 71% of global coal consumption for the first time in 2014, and coal remains the region's dominant fuel. Gas is the dominant fuel in Europe & Eurasia and the Middle East, while oil is the largest source of energy in the Americas and Africa.

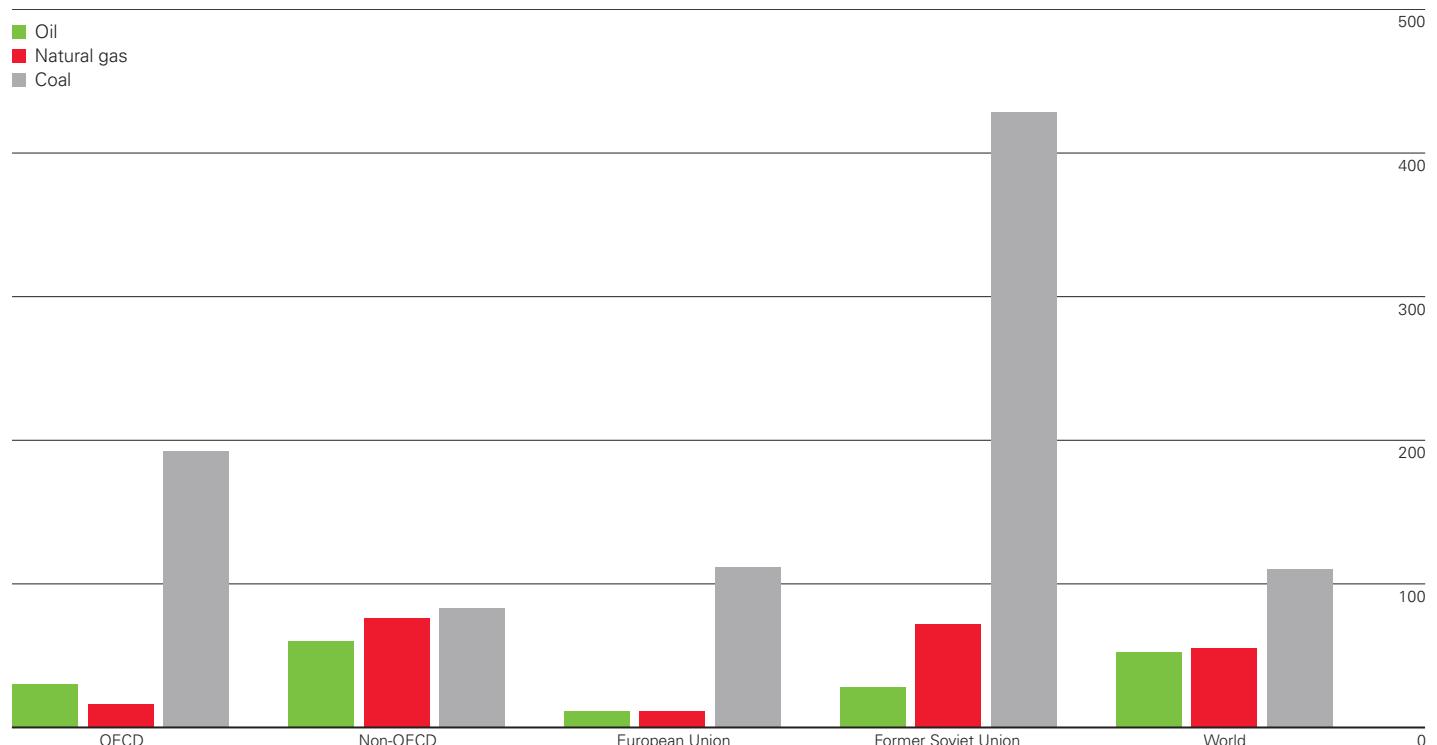

## Consumption per capita 2014

Tonnes oil equivalent

## Fossil fuel reserves-to-production (R/P) ratios at end 2014

Years

Coal remains – by far – the most abundant fossil fuel by R/P ratio, though oil and natural gas reserves have increased over time. Non-OECD countries account for the majority of proved reserves for all fossil fuels. The Middle East holds the largest reserves for oil and natural gas, and the highest R/P ratio for natural gas; South & Central America hold the highest R/P ratio for oil. Europe & Eurasia holds the largest coal reserves and the highest R/P ratio.

## Definitions

Statistics published in this review are taken from government sources and published data. No use is made of confidential information obtained by BP in the course of its business.

Country and geographic groupings are made purely for statistical purposes and are not intended to imply any judgement about political or economic standings.

### North America

US (excluding Puerto Rico), Canada, Mexico.

### South & Central America

Caribbean (including Puerto Rico), Central and South America.

### Europe

European members of the OECD plus Albania, Bosnia-Herzegovina, Bulgaria, Croatia, Cyprus, Former Yugoslav Republic of Macedonia, Gibraltar, Malta, Romania, Serbia and Montenegro.

### Former Soviet Union

Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine, Uzbekistan.

### Europe & Eurasia

All countries listed above under the headings Europe and Former Soviet Union.

### Middle East

Arabian Peninsula, Iran, Iraq, Israel, Jordan, Lebanon, Syria.

### North Africa

Territories on the north coast of Africa from Egypt to western Sahara.

### West Africa

Territories on the west coast of Africa from Mauritania to Angola, including Cape Verde, Chad.

### East and Southern Africa

Territories on the east coast of Africa from Sudan to Republic of South Africa. Also Botswana, Madagascar, Malawi, Namibia, Uganda, Zambia, Zimbabwe.

### Asia Pacific

Brunei, Cambodia, China, China Hong Kong SAR\*, Indonesia, Japan, Laos, Macau, Malaysia, Mongolia, North Korea, Philippines, Singapore, South Asia (Afghanistan, Bangladesh, India, Myanmar, Nepal, Pakistan, Sri Lanka), South Korea, Taiwan, Thailand, Vietnam, Australia, New Zealand, Papua New Guinea, Oceania.

\*Special Administrative Region.

### Australasia

Australia, New Zealand.

### OECD members

**Europe:** Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey, UK.

**Other member countries:** Australia, Canada, Chile, Israel, Japan, Mexico, New Zealand, South Korea, US.

### OPEC members

**Middle East:** Iran, Iraq, Kuwait, Qatar, Saudi Arabia, United Arab Emirates.

**North Africa:** Algeria, Libya.

**West Africa:** Angola, Nigeria.

**South America:** Ecuador, Venezuela.

### Units

1 metric tonne	= 2204.62lb = 1.1023 short tons
1 kilolitre	= 6.2898 barrels = 1 cubic metre
1 kilocalorie (kcal)	= 4.187kJ = 3.968Btu
1 kilojoule (kJ)	= 0.239kcal = 0.948Btu
1 British thermal unit (Btu)	= 0.252kcal = 1.055kJ
1 kilowatt-hour (kWh)	= 860kcal = 3600kJ = 3412Btu

### Calorific equivalents

One tonne of oil equivalent equals approximately:

Heat units	10 million kilocalories 42 gigajoules 40 million British thermal units
Solid fuels	1.5 tonnes of hard coal 3 tonnes of lignite
Gaseous fuels	See Natural gas and liquefied natural gas table
Electricity	12 megawatt-hours
One million tonnes of oil or oil equivalent produces about 4400 gigawatt-hours (= 4.4 terawatt-hours) of electricity in a modern power station.	
1 barrel of ethanol	= 0.57 barrel of oil
1 barrel of biodiesel	= 0.88 barrel of oil

### European Union members

Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, UK.

### Non-OECD

All countries that are not members of the OECD.

### Methodology

The primary energy values of nuclear and hydroelectric power generation, as well as electricity from renewable sources, have been derived by calculating the equivalent amount of fossil fuel required to generate the same volume of electricity in a thermal power station, assuming a conversion efficiency of 38% (the average for OECD thermal power generation).

Fuels used as inputs for conversion technologies (gas-to-liquids, coal-to-liquids and coal-to-gas) are counted as production for the source fuel and the outputs are counted as consumption for the converted fuel.

### Percentages

Calculated before rounding of actuals. All annual changes and shares of totals are on a weight basis except on pages 6, 13, 16, 18 and 20.

### Rounding differences

Because of rounding, some totals may not agree exactly with the sum of their component parts.

### Tonnes

Metric equivalent of tons.

## More information

### Questions on data

BP regrets it is unable to deal with enquiries about the data in *BP Statistical Review of World Energy 2015*.

### Quoting from the review

Publishers are welcome to quote from this review provided that they attribute the source to *BP Statistical Review of World Energy 2015*. However, where extensive reproduction of tables and/or charts is planned, permission must first be obtained from:

#### Paper

This document is printed on Oxygen paper and board. Oxygen is made using 100% recycled pulp, a large percentage of which is de-inked. It is manufactured at a mill with ISO 9001 and 14001 accreditation and is FSC® (Forest Stewardship Council) certified. This document has been printed using vegetable inks.

Printed in the UK by Pureprint Group using their *alcofree*® and *pureprint*® printing technology.
