

CABLE GRIPPER

Technical Data / Specifications

Grips Cable up to Ø100 mm

23 tonne maximum line pull

Overview

The cable gripper tool is used to recover underwater cables to the surface. The cable gripper is a hydraulic jaw mechanism which remains mechanically locked after the hydraulics are removed.

The unit is normally fitted with a hydraulic connect/eject system to disconnect it from the ROV once the gripper has been connected to the cable. In an emergency, it will eject automatically if sufficient mechanical pull load is put on the eject mechanism.

Different jaw sizes are available to suit various cable diameters.
