

SUBSEA FLOWMETER

Overview

Oceaneering's Flowmeter consists of an OEM Flowmeter Body with an OEM Pick-up sensor. This Sensor is contained in a small oil-compensated housing. It is interfaced via a 3 Pin Bulkhead, which includes a Water Alarm for the oil compensated area.

Each assembly has a Calibration Value that must be used in the software to calibrate the output from the unit.

Oceaneering's Flowmeters are available in a variety of sizes for accurate flow measurements.
