**Overview**

The Subsea Intelligent Display is a multi-purpose display that can take an input from various sources, such as pressure, torque and pH. It is primarily used in conjunction with subsea torque test jigs and pressure intelligent displays, but it can be used with a variety of other applications.

The Subsea Intelligent Display can be interfaced to an ROV via an RS232 link and can be powered by the ROV. The data can be monitored topside by a Graphical User Interface (GUI).
